Hospital Management System - Project Description Report

Student: Cedric
Institution: ULK Polytechnic Institute
Course: Object-Oriented Analysis and Design (OOAD)

Introduction

The Hospital Management System is designed to improve the management of hospital operations by organizing patient records, doctor information, appointments, prescriptions, and billing processes.

Problem Statement

Manual hospital record management may cause delays, scheduling conflicts, and data loss. This system provides a centralized digital solution.

Objectives

Manage patients, doctors, appointments, prescriptions, and billing information while demonstrating UML and object-oriented design concepts.

Project Scope

Included: patient management, doctor management, appointment scheduling, prescription management, billing management. Excluded: online payments, laboratory management, pharmacy inventory, ambulance services.

System Users

Hospital administrators, doctors, receptionists, and patients.

Main Classes

Patient, Doctor, Appointment, Prescription, and Bill.

Expected Benefits

Improved record management, reduced paperwork, accurate billing, and efficient appointment scheduling.

Conclusion

The project demonstrates software analysis and design principles through a practical hospital management system model.
